EARLY ATLASES AND PRINTED BOOKS FROM THE MANCHESTER GEOGRAPHICAL SOCIETY COLLECTION: A CATALOGUE

ANDREW LLOYD*

JOHN RYLANDS RESEARCH INSTITUTE, UNIVERSITY OF MANCHESTER

INTRODUCTION

The Manchester Geographical Society, founded in 1885, can in many ways be seen as the most important of all the provincial geographical societies in the United Kingdom.1 Certainly in its Edwardian heyday it rivalled the Royal Geographical Society in London in many of its achievements. Yet six months before its foundation, a similar attempt to establish a Society of Commercial Geography in Manchester had failed. It is from this inauspicious beginning that the main motivation for setting up such a society becomes apparent. In the 1880s the first perceived threat of foreign competition was emerging, and the markets of Africa and the Far East were beginning to open up. The Society's emergence can be seen as a response to these factors and also to the establishment of a growing number of similar organizations on the Continent.2 The expressed aim of the Society was to record knowledge of the world, including information about the newly-available

* The author wishes to express gratitude to a number of individuals and organizations, without whom this publication would not have been possible. Particular thanks are due to Paul Hindle, the Honorary Secretary of the Manchester Geographical Society, for his enthusiastic contribution, and to David Miller, Deputy Librarian, for orchestrating support from the John Rylands University Library of Manchester. Within the Library many individuals have contributed to the success of this project, notably Anne Pilkington for always finding time to offer much needed advice, Clive Field and Dorothy Clayton for their editorial support, Brenda Scragg for her unparalleled knowledge of the collections, Charlie Hulme for his invaluable technical assistance, and June Smith for her willingness to help. Staff in the Department of Geography in the University also contributed in a significant way. John Grannan helped to produce the computer-based catalogue records, Keith Sutton and Wilf Theakstone used their area knowledge to good effect in the selection of specific items for cataloguing. Special thanks must finally go to the University Map Curator, Chris Perkins, without whom the project would not have started. During the last eighteen months his help, advice and occasional badgering were all necessary in ensuring successful completion of not only the project but also this catalogue. At the end, of course, only I am to blame for the errors and inaccuracies that remain.

2 The 1870s and 1880s saw the development of a number of geographical societies in Europe, often with a colonial or mercantile bias, e.g. the Société de géographie commerciale de Bordeaux, est. 1874; the Geographische Gesellschaft in Hamburg, est. 1873; and the Societa di studi geografici e coloniali, est. 1893.
markets. It was recognized that commercial success depended upon such information. Within the promotional literature of the Society the point is reiterated: 'One thing is certain, and that is that one must have some knowledge of the geography of a foreign country if one would develop extensive trade relations with that country in an effective manner'. The Society was set up by prominent members of the Manchester business community, and aimed primarily to serve the interests of others in that same group. This commercial bias formed only part of the Society's remit. There was also a commitment to encourage the teaching of geography at all levels, and it is in this educational sphere that the Society was most successful.

The Manchester Geographical Society achieved a rapid rise to a position of prominence in its early years. This demonstrated the need for such an organization, and reflected the energy and enthusiasm of those prominently involved. These same individuals must take much of the credit for the ultimate size and stature of the Society's Library; for well over half the collection came from the private libraries of prominent members and benefactors. Foremost among these 'pioneers' was Eli Sowerbutts, the first full-time secretary of the Society, who remained the driving force within it until his death in 1904. On his death his collection of about 1,500 geographical works was transferred to the Society's Library. Whilst this element of the collection remains its most significant part, both in terms of quantity and quality, there were a number of other prominent individual contributors. The interests of these individuals are apparent in the nature of the material they donated. This is particularly the case with the eighteenth-century travel accounts bequeathed by the prominent local antiquarian Charles Roeder, and in the significant section of works concerned with African exploration, given to the Society by William Booth Leech.

The size and stature achieved by the Society in its early days could not, unfortunately, be maintained. Although the Library of over 5,000 works remained largely intact, it had by the 1960s become scattered throughout the Society's premises, and it was in a somewhat dilapidated condition. Growing pressures of finance and accommodation led, therefore, to the transfer of the collection to the Manchester University Library in the early 1970s. Unfortunately the collection was then split up. Due to their size and value, the atlases and larger books were soon moved to the original John Rylands Library in Deansgate, Manchester. No catalogue records were created for this material. Other parts of the collection were housed in different departments within the University Library. The lantern slides, for example, went to the audio visual department in the University Library, and some of

---

the maps were placed in the university map collections, housed in the Department of Geography in the Mansfield Cooper Building. The main body of smaller books and periodicals were ‘store’-catalogued into the Library’s Dixon Store: the result of this superficial level of cataloguing was that access to this material was restricted, the only available catalogue record being a single entry in the name card catalogue.

The initiative for the setting up of a project to improve access to the entire collection began during the Society’s centenary, after some of the atlases had been ‘rediscovered’ and exhibited at the Deansgate Library. The Society’s Honorary Secretary, Paul Hindle, examined the collection carefully, and the setting up of the project was his idea. Funding was provided by the Manchester Geographical Society and the John Rylands Research Institute founded in 1988. The main aim of the project has been to improve access to the more important sections of the collection, particularly the atlases and rarer books, because no records of these works had ever been made. The scope of the project not only encompassed the cataloguing of the important parts of the collection, but also the publishing of results in a printed catalogue, and the conservation of the most valuable parts of the atlas collection. Initially the project was to run for a nine-month period. However, the quality of the material exceeded expectations, and the project was extended to eighteen months, additional funding again being provided by the Society and the John Rylands Research Institute.

The total number of books in the collection is just over 4,000, of which approximately one-third have been catalogued. Books to be catalogued were selected by Chris Perkins, the Map Curator at the University Library, and Andy Lloyd, the present writer and the cataloguer appointed to the project, in conjunction with other members of the University staff who have specialist knowledge of particular parts of the collection. How were the books to be catalogued selected? The main criteria included the age and monetary value of the work, the importance of its subject matter, its esoteric worth, the level of use to which the work had previously been put, and the extent of duplication elsewhere in the University Library’s stock. The resultant catalogue records have been created in UK MARC format, broadly following the rules set down in AACR2. The advantages of this system are threefold. First, the records are in machine-readable form and the user can obtain the information from a wide choice of access points. Secondly, the user-community is potentially very large, insofar

---

as the MARC system has become the accepted interchange standard in the UK library community; this has the effect of giving outside users access to catalogue records. The third advantage of this system is the flexibility offered to the record holder; a variety of output forms can be generated, and the records can be sorted in a number of ways.

In addition to the books and atlases the Society's Library is made up of c. 450 periodical and series titles, a number of flat map sheets, and lantern slides – the popular method used to illustrate the earlier lectures of the Society. The journals were largely collected through an exchange system operated with other geographical societies and government bodies. Many of these titles are not commonly found in this country, and a list of these will appear within the full printed catalogue. The present catalogue records only those items which are to be permanently housed in the Deansgate building of the John Rylands University Library of Manchester. These consist of over 200 atlases and just over 200 books, the book collection representing the most valuable works in the antiquarian part of the collection. Whilst nearly all the seventeenth- and eighteenth-century works in the collection will be found here, less than one-third of the items published between 1800 and 1850 are included.

Perhaps the most significant section of the Manchester Geographical Society's Library is the fine collection of two hundred or so atlases. For the purposes of this catalogue a functional definition of an atlas has been used. The changing nature of cartography and cartographic works precludes a precise objective definition of what is or is not an atlas. The main point of disagreement in the literature stems from what constitutes an allowable proportion of text in an atlas. Hence bibliographies and catalogues have 'drawn the line' between book and atlas at different points. Whilst agreeing, therefore, with the definition of an atlas as 'a collection of maps designed to be kept (bound or loose) in a volume', the presence of some text does not preclude any particular item from being included in this listing as an atlas. The basis for inclusion here is the contemporary function of any one item. This includes both the perceived way in which an atlas was used, and the intent of those responsible for the content. Cosmographies such as those produced by Heylyn and Bowen have been excluded, not only because these works contain comparatively few maps, but also because they were designed as items of geographical and historical description. The text in these cosmographies was not solely designed to illustrate the maps. These examples can be compared to works included in this

7 It is planned that these records will be added to the Consortium of University Research Libraries (CURL) database. At present this includes entries from six university libraries: Edinburgh, Glasgow, Manchester, Leeds, Oxford and Cambridge.

catalogue as atlases, such as Weigel's *Atlas portatilis*\(^9\) and Buy De Mornas's *Atlas historique et géographique*.\(^{10}\) Both these contain significant sections of textual material, yet this text is closely based upon the maps, and the works were designed to be used as atlases.

The viewing of atlases as social documents is becoming increasingly popular amongst historians of cartography. Furthermore, there are a number of benefits to be gained from placing atlases in their historical and cultural context.\(^11\) In the past, historians of cartography were more concerned with the quality and accuracy of the maps, and with the reputation, scarcity and value of the atlas. Such approaches ignored the social, political and economic background to cartographic production. Recent contextual approaches, on the other hand, pay attention to the atlas in terms of its place in the development of cartographic techniques and surveying, and also in the selectivity of their content and in their signs and styles of representation.\(^{12}\) These approaches, adopted by Harley and others, are important because they integrate the history of cartography into the mainstream of cultural history, rather than it being an isolated field of research for bibliographers and antiquarians. The analysis which follows attempts to explain the significance of the Manchester Geographical Society's collection by following such an approach.

Chronologically, the atlases cover the period from the start of the eighteenth century to the start of the 1960s, and within this period three general phases of atlas production can be identified. Not only does each of these phases represent a particular style of cartography, but changes in technology, and in the ways in which geography was studied, also appear to have precipitated changes in the type of atlas produced. The first of these periods broadly covers the whole of the eighteenth century, a period largely dominated by French cartographers such as Jean Baptist Bourguignon d'Anville and Guillaume de L'Isle. The nineteenth-century atlases in the collection are mainly of English origin. Large numbers are the products of a few family firms; A. & K. Johnston, Philips and Bartholomew. The type of atlas produced by one firm can be observed throughout this period, providing an opportunity to examine changes in style, not only in the cartography, but also in the other elements of atlas production. The atlases of the twentieth century are marked out by an increase in their specialization, both in terms of area and subject. A good example of such a trend is Howell's *Agricultural atlas of Wales*,\(^{13}\) which not only represents a comparatively small geographical area, but also reflects the more precise thematic nature of geographical study.

\(^9\) Weigel - AMGSA1 (1720).
\(^{10}\) Buy de Mornas - AMGSC7/8 (1761–62).

\(^{13}\) Howell - AMGSB66 (1921).
The most noticeable and often outstanding feature of the eighteenth-century atlases is the decorative engraving of the maps, particularly the increasingly ornate cartouches. Mostly hand coloured, particularly fine examples within the collection are the atlases by Philippe and Robert de Vaugondy. The maps being produced at that period also benefited from significantly more precise methods of surveying. In describing such works R.V. Tooley has stated that 'these atlases merit a place in any collection, for they mark the transition from speculative cartography to exact observation on the ground'.

The maps within these atlases were essentially topographic, and were usually derived almost wholly from earlier works or from maps produced by competitors. It is difficult to portray the precise way in which the 'map trade' was conducted because there are few surviving documentary records. Indeed it is often only through the maps that this can be done. Plates might be passed within families; maps were frequently plagiarised, and occasionally they were stolen from competitors. 'The incorporation of older and foreign surveys into new maps was the easiest and commonest way of making maps. The map-seller's only real protection was his ability to beat his rivals to publication'.

It is not surprising, therefore, that some common practices and mistakes were repeated. This point can be illustrated by reference to the collection, using an example from An atlas of maps by Herman Moll. Particular attention has been paid to those additions made to Moll's Map of the West-Indies which refer to the routes supposedly taken by treasure fleets along with the somewhat bizarre assertion that: 'In this Gulf or Bay you may know what distance you are from ye Shoar by Sounding ye depth of water, and as many fathom as you find, so many Leagues you are from ye Shoar'. These additions were not the original work of Moll and were themselves copied by such eminent cartographers as De L'Isle, appearing in an only slightly modified state as late as 1795 in Kitchin's A new universal atlas. This is itself unusual as this atlas was predominantly a reworking of the cartography of d'Anville and Robert de Vaugondy, neither of whom appears to have copied from Moll's map.

14 Philippe - AMGSB4 (1768).
15 Robert de Vaugondy - AMGSC6 (1757).
18 Moll - AMGSC3 (173-?).
20 Kitchin - AMGSC16 (1795).
21 The treasure fleet routes are marked thus on the maps produced by Moll and Kitchin: Moll – (i) 'The tract of the Flota from la Vera Cruz to ye Havana, occasiones by ye trade winds', and (ii) 'The tract which the Gallions made from Cartagena to the Havana; Kitchin – (i) 'Former course of the galeons from la Vera Cruz to the Havana to avoid the trade winds', and (ii) 'The former course of the galeons from Cartaghena to the Havana'. 
Increasingly sophisticated surveying techniques in general marked a move away from such speculative cartography. De L'Isle in particular has been noted for not being afraid to leave blanks, particularly in Africa where the long-standing practice of filling the interior with two central lakes was abandoned. The eighteenth century also saw a number of developments in the way in which relief was depicted. The introduction of ‘hachures’, for example, was a particularly significant change.22 A relatively early example of this practice is Carte générale du théâtre de la guerre en Italie et dans les Alpes23 published in 1798 by Bacler d’Albe, probably in response to the interest surrounding the revolutionary war and Napoleonic campaigns in southern Europe. It is also the largest atlas in the collection, measuring some 66 × 91 cm., and contains maps published at an approximate scale of 1:250,000.

The most notable atlases produced in Britain in the eighteenth century were the shipping charts and coastal pilots. Particularly well-known examples within the collection are the works of Greenville Collins and Murdoch Mackenzie. The predominance of this type of mapping can perhaps be related to Britain’s maritime superiority. The popularity of the atlas produced by Collins is clear; twenty-one editions were produced in a hundred-year period.24 This tradition of maritime atlases was continued into the nineteenth century, one example being Huddart’s A coastal pilot of Great Britain25 published by Laurie and Whittle. Several editions of these charts are contained within the collection. It is interesting to note that it is the charts closest to the coast that were revised most often. It is difficult to say, however, whether this was the result of further surveys or the correction of previously undetected errors.

One of the most important works produced in the first half of the nineteenth century was A.K. Johnston’s Physical atlas, first published in 1848.26 It was the first British atlas to move markedly away from topographic mapping, being largely based on Berghaus’s Physikalischer Atlas. The emphasis of the work is similar to that of Berghaus, the four sections being subtitled Geology, Hydrography, Meteorology and Natural History. This atlas is indicative of the changing nature of the study of geography, prompted undoubtedly by Alexander von Humboldt, to whom the work was dedicated. The second edition of the atlas was lithographed, one of the first atlases to be produced using this technology.27 The effect of the introduction of this process was to

reduce greatly the cost of atlas production, enabling a relatively small number of family firms to produce a range of large and impressive atlases at a comparatively reasonable cost.

The atlases produced by Philips, Edward Stanford and A.K. Johnston often contained nearly one hundred maps, their height measuring up to 50cm. The different editions of these works, which were produced over a relatively short period of time, show the extent of the demand. This demand was in part created by the increasing interest in the study of geography. It is interesting to note how the particular facets of this interest were represented in the atlases being produced. The atlases in this part of the collection can be divided into three broad types: the large, impressively designed folio atlases; a number of mid-range 'popular' items; and the educational works which were increasingly produced. Of the folio atlases perhaps the most important are those published by Edward Stanford and A.K. Johnston. Stanford's Atlas originated largely from the London atlas produced by John Arrowsmith. It was issued in four editions between 1887 and 1920, the number of maps it contained increasing from ninety to 115. The maps added in the different editions are particularly interesting, a majority showing coverage of the various parts of the British Empire. Furthermore, the preface to the atlas seeks to highlight these additions as beneficial to the atlas. Of the maps added in the 1904 edition, for example, British South Africa, and other maps specifically noted as showing British possessions, are mentioned on the title page. The preface to the atlas states that: 'One of the main objects of the Atlas was the efficient representation of the British Empire, and in the present volume it will be seen that no less than 83 out of the 110 maps shows the British red'. The different editions of the Royal atlas of modern geography by A.K. Johnston mirror this process. The 1877 edition, for example, includes a new map of New Zealand, described as 'one of our most important and prosperous colonies', and the 1898 edition includes a new map of South Africa.

The new British Empire maps added to the atlases of both these major publishers show the competition which existed in this market. The advertisements in the prefaces form part of their marketing strategy. The biographical information on the leading atlas producers, however, demonstrates that they were also often both positive and prominent imperialists. The desire to extol the virtues of Empire came, therefore, as much from jingoistic imperialism as from the pressures of a competitive market. J.B. Harley directly assimilated

29 Johnston – AMGSC57 (1899).
30 E.g. on Bartholomew, see T. Cook, 'A reconstruction of the world: George R. Parkin's British Empire Map of 1893', *Cartographica*, 21 (1984), 53–65.
such mapping with the new imperialism: 'As communicators of an imperial message, they [maps] have been used as an aggressive complement to the rhetoric of speeches, newspapers, and written texts, or to the histories and popular songs extolling the virtues of empire'.

The folio editions of the atlases by Stanford and Johnston undeniably give legitimacy to the frontiers agreed by the colonial powers, political colouring being evident on many of the maps. The folio atlases of Johnston and Philips also provided the raw material for a number of cheaper and more popular items, produced for, and aimed at, the 'family market'. These works also possess a greater imperial emphasis, the political maps being coloured more strongly to accentuate the British colonial possessions. The choice of red as the colour used to represent the British Empire has not been examined in great detail. The symbolic strength with which red has been identified may perhaps be contrasted with the fact that German atlases of the same period coloured British possessions 'a sickly yellow colour which is perhaps symbolic of cowardice'.

There are also a number of less well-known atlases in the collection published in this period. The maps they contain are often set alongside imagery which almost exclusively concentrates on the superiority of empire. A comparatively early example of such a work is Letts's popular atlas, published in 1889. The frontispiece is made up of a chart showing the flags of all nations, in which considerable prominence is given to the British Empire; the world map (on Mercator's projection) is only coloured to show British possessions; and the locations of British consulates and their agents are heavily marked on the other maps. A somewhat more extreme example is W. Bisiker's Atlas of the British Empire and Japan. Published in 1909 it is not just the exclusive concentration on the Empire and its newest ally which makes this atlas noteworthy. The increasing interest in commercial geography is reflected in illustrations of a region's 'principal commercial products', other illustrations depicting crude racial stereotypes and detailing information on the history of colonial acquisitions.

Whilst the content of these works was undoubtedly influenced by the values of the map-producing society, a deliberate attempt to accentuate the legitimacy of empire was also present. The content of the maps subliminally focused attention on imperial possessions while

31 Harley, 'Maps', 282.

34 Mercator's projection has been shown to emphasize the size of the British Empire in the late nineteenth century. Parts of Australia and Canada frequently appear at both ends of a map. E.g. see Ager, 'Maps and propaganda', 4–9; Cook, 'Reconstruction', 53–65.
35 Bisiker - AMGSB58 (1909).
the accompanying text propounded the social ethos of those who ran the British Empire.

The concept of deliberate and polemic mapping appears to have been more often applied to the twentieth century than to the period immediately leading up to the First World War. Analysis has thus been made of the mapping of Nazi Germany, and of the state-produced national atlases, particularly those of the Eastern Bloc and Third World. The Society’s atlas collection contains examples pertinent to both these cartographic debates, although the ‘Saar-Atlas’, published in 1934 by Perthes, is not such an aggressive example of propaganda mapping as that which later characterized the Nazi régime. It is nevertheless important as it focuses on the region ‘de-industrialized’ by the Versailles treaty, an area rich in mineral resources, and therefore an area of importance to the economic regeneration of Germany in the 1930s. Produced by the Saar Research Council, the mapping and other statistical information reflects this controversy. The atlas concentrates heavily on economic and industrial themes, making a number of economic comparisons relevant to before and after the Versailles treaty, as well as highlighting the ‘German’ history of the area. There are few maps pertaining either to the physical characteristics of the region, or to social and cultural themes. The emphasis, and the percentage of space, devoted to particular types of mapping have also been discussed for post-war national atlases. Robert Kent, for example, in a statistical study, calculated that ‘economic maps are the most dominant and command an average of about 35 per cent of both the maps and the space devoted’.

It is perhaps not surprising that such atlases should be found in the Society’s collection. The presence of English translations indicates that they were often produced as much for overseas consumption as for the domestic market. National atlases, therefore, were often produced as prestige items, and were not intended to be economically viable. This is a point which is emphasized by this extract from the foreword of an Atlas estatistico do Brasil: ‘On publishing and distributing this atlas, the National Coffee Department of Brazil is giving its collaboration to the essentially patriotic work of making Brazil better known throughout the world’. This is also largely a work in which

39 Saar – AMGSB69 (1934).
41 Brazil – AMGSB72 (1941).
the maps are of an economic nature. Furthermore, the collaborating publishers mentioned above may have partially influenced the contents. Within the atlas sixty per cent of the space is devoted to economic mapping, fourteen per cent of this being relevant to coffee, an amount just under eight per cent of the total content. It should also be noted that this information depicts the positive side of the coffee industry. No information is given concerning wage levels, or the proportion of gross national product enjoyed by the coffee workers. Furthermore, nearly all of the graphs in the atlas present a favourable impression. The statistics represented appear to have been chosen to illustrate upward trends, and the accompanying use of colour and illustration reinforces this.

The East German *Weltatlas*, published in 1952, has been similarly designed. Most of the information is of a cartographic nature, economic maps being placed alongside a physical counterpart. The symbols used to illustrate certain industrial and mineral resources are of such a size and colour, however, that the maps frequently appear packed and overcrowded. The intention may have been to emphasize the economic and industrial strength of the Eastern Bloc, particularly the German Democratic Republic. The concentration of such mapping in the national atlases of these states is evident in other examples, a point noted by Kent, who argued that: ‘Perhaps the emphasis on industry in the atlases of the Eastern Bloc ... reflects a concern and a high priority for industrial development in these nations, rather than its economic importance’. This atlas does not fulfil all the criteria of a national atlas, as it does not contain maps solely relevant to the producing nation. It does contain, however, a significant bias towards Germany, there being eight maps devoted to this area, as against only two which give incomplete coverage to the United States. Like a great number of less polemic works it also has a ‘homeland priority’, yet it is interesting that in most of the political maps the division between the German states does not appear. Whilst cartographers in West Germany have consistently refused to recognize this frontier, the border has appeared on most East German maps.

The section of the Manchester Geographical Society’s book collection housed in the Deansgate building of the John Rylands University Library of Manchester is both varied and diffuse. It comprises the best of the 4,000 books in the Society’s collection. Several criteria have been used to select these ‘better’ books. Perhaps foremost of these was the general importance of a particular work. It is difficult to assess the significance of works: different researchers have different interests and opinions vary about what is or is not important. Several absolute

---

42 VEB - AMGSB75 (1952).
43 Kent 'National atlases', 129.
criteria have, however, been used. The age, scarcity and value of particular works were the most important factors considered. A significant proportion of the books published prior to 1850 have therefore been included. The scarcity and value have been judged largely on the basis of prices listed in recent editions of appropriate reference guides. Additional criteria have also been considered. A greater weight, for example, has been given to primary sources, particularly accounts of exploration in regions previously unexplored by Europeans.

A summary breakdown of the area and date distribution of this section of the collection is given in the Table. In fact, the works form both a representative and fairly significant bibliography of travel and exploration within the period. Relatively little has been written about books of this kind. Research has concentrated either on the relationship between traveller and host, or on the quality of the works' descriptive information. The style of these works, and their socio-historical value, for example, have largely been ignored. This is perhaps surprising given the popularity they enjoyed; for books on travel had gained a readership second only to fiction by 1800. Furthermore, the number of travel books published up to that date was greater than the number of fictional works. Both these factors are therefore important for the analysis of such a collection. There is little uniformity of style throughout the collection, in part because of the diversity of areas, periods and languages represented. Different types of travellers visited very different regions. Because the total volume of accounts relating to Europe was greatest, it would be misleading to concentrate exclusively on the ideas and descriptions which frequently accompanied the concept of the 'grand tour'. Later, more romantically inclined accounts, such as that by Eustace, for example, concentrate on the philosophy and beauty of the classical world. The style of such works is notably different from those relating to less well-known areas.

Analysis of this type of variation would not only aid the study of the traveller, but might also show how the social attitudes of those who read such accounts were formed. Given the popularity of these works, it would be surprising if they had no effect on those who read them. Carver's *Travels through the interior part of North America*, for example, includes a passage describing contact with some native

---

48 Eustace, BMGSA110 (1815).

49 Carver, BMGSA72 (1779).
Americans: ‘something that had the appearance of a herd of beasts . . .’. 50 Whilst this represents an isolated and probably extreme example, it provides an illustration of the different approaches adopted by the writers of such accounts.

The area coverage of this part of the Society’s Library is particularly wide (see Table). There are, however, disproportionately more books covering both Africa and Europe (including Great Britain). The large number of books written on Europe was probably due to the ease of access enjoyed by travellers, and by the proximity of these regions to Great Britain. The lack of significant political barriers to entry, and the improvements in the transport infrastructure which occurred in the eighteenth century, may have also contributed to demand. The market for a European guide-book, therefore, was probably larger than that for any other area.

The large number of books in this section which describe parts of Africa reflects the bias of the Society’s collection as a whole. It is particularly indicative of the interests of many of the Society’s early prominent members. Given the domination of the early history of the Society by the ideas of commercial expansion and imperialism, it is perhaps not surprising that Africa should predominate in its Library.

The period covered by the books in this section was also one in which significant exploration occurred in Africa. The demands of trade, and the associated developments in technology which facilitated the opening up of the African continent, resulted in a considerable
number of exploration accounts being published. Many of these works are contained in the collection, and together they form one of its most significant sections.

The African books listed in the catalogue illustrate some of the contextual information that can be derived from the collection as a whole. A number of books, for example, quite accurately portray the extent of European penetration of Africa at different times. This is not only apparent from original works of exploration, but also from the accounts of voyages and from some of the works of general geographical description. Early works, such as that by Villault, for example, demonstrate the rivalries between European powers, and show the type of trading relationship which existed between Europeans and the indigenous population. A mercantile bias towards recording this relationship is demonstrated both by those responsible for such works, and in the nature of their descriptions. As late as 1700, for example, a Dutch official, William Bosman, wrote of the Gold Coast that 'we have no means of getting to these treasures, nor do I believe that any of our people have ever seen a single one of these mines'.

The reliability of the seventeenth- and early eighteenth-century descriptions must, however, be viewed carefully. Alongside the maps of the period filled with wild beasts, spurious descriptions often appeared. This is particularly true of the secondary accounts, such as the well-known work of Ogilby. In this, personal accounts of explorers were embellished with very vague descriptions of other areas away from the coast. Ogilby, for example, sums up the inland kingdom of 'Zanfara' in five lines, stating that 'The inhabitants, exceedingly black, and of large stature . . . are savage and wild of disposition'. The choice of descriptions of unknown areas is interesting. It is probable that this both reflects the general perceptions held of such areas, and further reinforces them. The overall style of these accounts of Africa is generally dry and wholly descriptive. The narrative concentrates almost exclusively on the characteristics of both land and people. The value of these works as source materials is therefore very debatable. The contrast that exists between these works and the early nineteenth-century exploration accounts is not solely confined to the style of their description. Further, the significance of the nineteenth-century accounts of exploration lies outside the question of their style. The overwhelming importance of this exploration was the effect of European penetration into parts of the African interior. The content of these accounts demonstrates the motivation behind the surge of exploration, and the legacy it provided for both

Europe and Africa. The significance of this effect cannot be underestimated, as it paved the way for the expansion of commerce and missionary enterprise and furthered imperial expansion, particularly by Britain and France. There is much debate, for example, as to what factors prompted the desire to gain a greater knowledge of the African interior. The movement for the abolition of slavery, for example, is one factor that has often been cited. This opinion, however, was not one shared by Mungo Park, sent in 1795 by the African Association to the West coast. In the account of this journey Park stated that: 'in the present unenlightened state of their minds . . . the effect [of abolition] would neither be so extensive or beneficial as many wise and worthy persons would fondly expect'.

Nineteenth-century accounts suggest that explorers had both commercial and scientific motives. The commercial objectives are clear, for example, in the government-sponsored expeditions such as that of Allen and Thomson. That the expeditions were greatly interested in science can also be shown from the personnel employed, and in the resultant scientific appendices in accounts such as that of Tuckey's exploration. Later expeditions were more concerned with the abolition of slavery along with the expansion of other forms of trade. Allen and Thomson's expedition, for example, had the following brief: to enter into 'commercial relations with the chiefs and powers' and 'to arrest the foreign Slave Trade in its source, by counteracting the principles by which it is now sustained'. It is significantly more difficult to assess the legacy left by these expeditions, particularly when there are comparatively few accounts. Their use of language, and the conclusions they offer, however, do give some indications of how the imperialist era may have begun. The concluding part of Allen and Thomson's account, for example, puts forward the idea of the establishment of a colony as a solution to the slave trade. The ending of the political instability which Allen felt to be hindering this process was not the only motivation behind this idea. In addition, a colony would 'give an opportunity for the expansion of native intellect, which must be productive of benefit on the race generally'. Whilst Allen's plan was rejected, the ethos of the paternalism and racism which marked the imperialist age was clearly already well established. The accounts relating to such expeditions not only

56 Park, BMGSA113 (1816), v.1, 444.
57 Alien and Thomson, BMGSA150 (1848).
58 Included on Tuckey's mission to the Zaire River for the purpose of scientific research were Professor Smith, botanist and geologist, Mr Tudor, comparative anatomist, and Mr Cranch, collector of objects of natural history. See Tuckey, BMGSB66, xxxviii.
60 Alien and Thomson, v.2, 435.
provide interesting and well-written accounts of exploration, but have a value as source material in the history both of Africa and of Britain.

The works of exploration in the collection of the Manchester Geographical Society are not confined to Africa. Significant accounts of Oceanic exploration include a comparatively rare account of the voyage and subsequent mutiny aboard the Bounty written by Fletcher Christian.\(^{61}\) The voyages of Captain Cook\(^{62}\) are also noteworthy, particularly because of the accompanying plans and plates illustrating the natural history of the places visited. The accounts produced by Cook and others provided a stimulus to the production of works of 'universal geography'. These works spread factual knowledge of recent geographical exploration to a wider audience, often very soon after the original discovery. As early as 1780, only a year after Cook's death, the work of the Rev. Thomas Bankes included a description of the discoveries made on the voyages undertaken by Cook.\(^{63}\) Such works comprise another of the significant sections in the Society's Library. They are important to historiographers because they were the textbooks of eighteenth- and early nineteenth-century geography. One part of their contemporary value seems to have been their currency. They were large compendia, often impressively put together with ornate appearance and often containing relatively accurate maps. The quality and accuracy of the text has been criticized, although the value of the maps and other engravings remains largely undiminished. This is particularly true, for example, of Camden's *Britannia*.\(^{64}\) This book's value to collectors and scholars alike has largely been derived from the maps. Based on the maps of Saxton, they are among the first county maps to have been made available in printed form. Similar examples are the works of Richard Blome\(^{65}\) and those which contain the maps of Emmanuel Bowen.\(^{66}\) Many of the works of 'universal geography' published in the eighteenth and early nineteenth centuries do not, however, enjoy such an esteemed reputation. Those responsible for their production have often been accused of plagiarism. The style of prose employed has been criticized as solely consisting of 'detailed analysis of contemporary political divisions, and lists of cities, ports, commercial products, and exports, uninspired by any unifying and vitalizing concept'.\(^{67}\) As such the significance of universal geographies for the study of the development of geography has also been questioned. This does not, however, detract from their value as large and impressively-put-together ornate works. Furthermore, they fulfilled

\(^{61}\) Christian, BMGSA89 (1796).

\(^{62}\) Cook, BMGSB34 (1785).

\(^{63}\) Bankes, BMGSB37 (1787).

\(^{64}\) Camden, BMGSB2 (1610).

\(^{65}\) Blome, BMGSB12 (1670).

\(^{66}\) BMGSB21/3 (1747).

the function of disseminating much of the newly-acquired geographical knowledge to a far wider audience than would have otherwise received it. The importance of the large circulation enjoyed by these books should not be underestimated. For the majority who read these accounts, they provided the only picture on which perceptions of such regions could be shaped. The language and style of such works, therefore, form an important element in both the actual and contextual study of history.

HOW TO USE THE CATALOGUE

This catalogue includes descriptions of the more important items in the collections of the Manchester Geographical Society. It is arranged in two sequences. The first comprises atlases, the second books. Both are arranged in chronological order by the date of publication. This date is emboldened in the catalogue entry for each item. The shelfmark which appears at the head of each catalogue entry comprises four different parts. It begins with A for atlases or B for books, followed by MGS. The next part shows the size of the item: C for large folios; B for folio-sized books; and A for quarto volumes. The final element in the shelfmark is a number for shelf ordering. The shelfmarks are, therefore, a unique means of identification for finding these works in the John Rylands University Library.

Last page of index wanting.

AMGSC3

MOLL, Herman

_[An atlas of maps by Moll]_

[Herman Moll]

[s.l.]

[s.n.]

[173-?]

1 atlas

[56] leaves of plates

65 x 56cm.

31 hand col. maps

Composite atlas consisting mainly of maps by Moll: together with d’Anville’s map of China; Hungary by P. Lea; the Roman Empire by Delisle.
Item lacks title or contents page: atlas appears to have been put together by a private individual, as different imprints appear on different maps.
Maps are variously dated between 1708 and 1734.

AMGSC4

DELISLE, Guillaume
[A composite atlas]
[Guillaume Delisle]
[Amsterdam]
[Covens and Mortier]
[174-?]
1 atlas
ca. 60 leaves of plates
59 x 66cm.
31 hand col. maps

A composite atlas without title page, contents or numbering: containing maps of France and some other parts of Europe, notably the Austro-Hungarian Empire.

AMGSC5

DELISLE, Guillaume
[A composite atlas]
[Guillaume Delisle]
[Amsterdam]
[Covens and Mortier]
[174-?]
1 atlas
ca. 50 leaves of plates
59 x 66cm.
24 hand col. maps

A composite atlas without title page, contents leaf or numbering: containing maps of most of the European states, and some of Asia and South America.

AMGSA2

Maps appear to be copies from d'Anville maps, with some additions.
AMGSA5
WALKER, John
[An atlas to Walker's 'Geography and gazetteer']
[John Walker]
[London]
[Darton and Harvey]
[1794]
1 atlas
[58] leaves of plates
22cm.
29 maps (some hand col.)

Item lacks title and contents page. Title information taken from Phillips, A list of geographical atlases in the Library of Congress, no. 689.
Publication details taken from the map imprints.

AMGSC16
KITCHIN, Thomas
A new universal atlas, exhibiting all the empires, kingdoms, states, republics &c. &c. in the whole world, being a complete collection of the most approved maps extant: corrected with the greatest care, and augmented from the last edition of d'Anville and Robert, with many improvements by Major James Rennell, and other eminent geographers engraved . . . by Thomas Kitchin
London
Robert Laurie, and James Whittle
1795
1 atlas
ca. 130 leaves of plates
56cm.
66 hand col. maps

Prime meridians: London and Calcutta.
Atlas probably compiled from the maps of d'Anville and Robert, with additions by Kitchin and others.
Maps are variously dated.

AMGSC17
Maps of Sweden
[s.l.]
[s.n.]
[1795?]
1 atlas
[50] leaves of plates
53cm.
25 maps (some hand col.)

Title taken from cover.
Composite atlas, containing various maps of Sweden by a number of different authors, mostly dated between 1770 and 1790.
Prime meridians: Ferro and Stockholm.

AMGSC18
KITCHIN, Thomas
A new universal atlas, exhibiting all the empires, kingdoms, states, republics &c. &c. in the whole world, being a complete collection of the most approved maps extant: corrected with
the greatest care, and augmented from the last edition of d'Anville and Robert, with many
improvements by Major James Rennell, and other eminent geographers
engraved . . . by Thomas Kitchin
London
Robert Laurie, and James Whittle
1796
1 atlas
cia. 130 leaves of plates
56cm.
66 hand col. maps
Prime meridians: London and Calcutta.
Atlas probably compiled from the maps of d'Anville and Robert, with additions by
Kitchin and others.
Maps are variously dated.

AMGSC19
A new and complete pilot from the mouth of the Thames to the Cape of Good Hope:
comprehending on a very extensive scale the whole of that navigation, chiefly selected from
the large East-India pilot, and particularly adapted for ships bound to the Cape only
London
Robert Laurie and James Whittle
1796
1 atlas
[48] folded leaves
74 × 31cm.
24 charts
Some charts by Captain Joseph Huddart.

AMGSC20
The coasting pilot for Great Britain and Ireland done from actual surveys and observations
by Joseph Huddart, George Burn, James Grosvenor . . . and many
other navigators
London
Printed for Robert Sayer [Laurie & Whittle]
[1800?]
1 atlas
[44] folded leaves
64cm.
22 charts
All the maps bear the imprint of Laurie & Whittle, who succeeded to the business of
Sayer ca. 1792.
Maps variously dated between 1794 and 1800.

AMGSC21
