Decline and Decadence in Iraq and Syria after the Age of Avicenna?
ʿAbd al-Laṭīf al-Baghdādī (1162–1231) between Myth and History

N. Peter Joosse and Peter E. Pormann

Summary: ʿAbd al-Laṭīf al-Baghdādī’s (d. 1231) work Book of the Two Pieces of Advice (Kitāb al-Nisāḥatayn) challenges the idea that Islamic medicine declined after the twelfth century AD. Moreover, it offers some interesting insights into the social history of medicine. ʿAbd al-Laṭīf advocated using the framework of Greek medical epistemology to criticize the rationalist physicians of his day; he argued that female and itinerant practitioners, relying on experience, were superior to some rationalists. He lambasted contemporaneous medical education because it put too much faith in a restricted number of textbooks such as the Canon by Ibn Sīnā (Avicenna, d. 1037) or imperfect abridgments.

Keywords: medieval Islam, social history, medical epistemology, women, charlatans, medical education, ʿAbd al-Laṭīf al-Baghdādī (d. 1231), Ibn Sīnā (Avicenna, d. 1037).

Historical narratives of decline and fall, of decadence and demise, tempted many scholars and intellectuals long before Edward Gibbon

N. Peter Joosse’s contribution to this article was made possible by the Vereniging Nederlands Tijdschrift voor Geneeskunde: it provided the financial support for his project “The physician as a rebellious intellectual: ʿAbd al-Laṭīf al-Baghdādī (1162–1231) and the Arabic medicine of his time,” which he carried out as a senior research fellow at Leiden University. Peter E. Pormann mainly worked on this article whilst a visiting researcher at the American University in Cairo; his research was generously funded by the Wellcome Trust (grant number 077558). When in Cairo, he also benefited tremendously from the resources available at the Institut Dominicain d’Études Orientales. The authors would like to express their gratitude to all of the above institutions for their assistance. Moreover, they would like to thank Sir Iain Chalmers and Professor Jan P. Vandenbroucke, editors of the James Lind Library, as well as the editors of the Bulletin and the anonymous referees for their comments, suggestions, and criticism.

wrote his influential eponymous work on the Roman Empire.\(^1\) In the sequence of polities that rose and fell, Islam obviously occupies a prominent place. In both the popular and the scholarly literature one finds the following narrative: united by the Prophet Muḥammad (d. 632), the Arabs conquered a large part of the world and built an enormous empire, only to sink into insignificance under the double onslaught of the military might of the Turks and Mongols and ever-increasing bigotry of Muslim clerics. As a subset of this narrative, the history of Arabic sciences and philosophy allegedly followed a similar pattern: after the glorious days of the eighth through tenth centuries when Greek texts became available through a massive translation movement, things went downhill. Medicine, in particular, is seen to have declined after the age of Avicenna (Ibn Sinā, d. 1037) and his massive *Canon of Medicine* (*al-Qānūn fi ʾt-ṭibb*).

Already in the nineteenth century, scholars claimed that Islamic culture waned after al-Ghazālī (d. 1111), the author of the *Incoherence of the Philosophers* (*Tahāfuṭ al-Falāṣīfa*), a polemical work directed against Avicenna.\(^2\) For instance, the Dutch Arabist Reinhart P. A. Dozy expressed this point of view extremely eloquently in his *Oration about the Causes Why the Culture and Humanity of the Muslims Was Diminished and Corrupted Compared to that of the Christians*.\(^3\) In a similar vein Carl Brockelmann called the whole post-1258 period in his *History of Arabic Literature* “the decline of Islamic literature” (*Niedergang der islamischen Literatur*).\(^4\) George Saliba recently labeled this periodization of Islamic intellectual history as the “classical narrative.”\(^5\) He argued that some of the most innovative research in the area of astronomy took place during this alleged age of decline and invited scholars of other disciplines to criticize this classical narrative in their turn.\(^6\)

---

In philosophy, too, this stereotypical picture has come under ever increasing criticism from different quarters. In the present article, we take up Saliba’s invitation and argue that the history of medicine in the medieval Islamic world does not conform to the facile pattern of decline and degeneration. The example of the physician and philosopher ‘Abd al-Latíf al-Baghdādī will show that in the late twelfth and early thirteenth centuries both medical practice and theory could be highly innovative. Moreover, ‘Abd al-Latíf’s example also emphasizes the need to write a social history of medicine in the lands of Islam. In his Book of the Two Pieces of Advice, the focus of our argument, ‘Abd al-Latíf emerges as a shrewd social critic and sharp commentator on the medical mores of his age. He lambasted charlatans, reflected on the practical applications of medical epistemology, and extolled female practitioners as superior to some of their male colleagues.

In order to highlight the sophisticated nature of ‘Abd al-Latíf’s medical writing—and to illustrate some of the trends in the social history of medicine in early thirteenth-century Iraq, Syria, and Egypt—we shall focus on a number of the most arresting aspects of the Book of the Two Pieces of Advice. As the medical section of this work has hitherto been nearly totally overlooked and neglected, and as to date no edition or translation of it exists, it will be necessary to quote a few striking passages from this masterpiece and to put them into their historical, medical, and philosophical contexts. First, however, it will be useful to take a closer look at ‘Abd al-Latíf’s life and work during the turbulent times of the third to the fifth crusades (1189–1229).

‘Abd al-Laṭīf al-Baghdādī’s Life

We have information about ‘Abd al-Laṭīf’s life mainly from three sources: 1) an extensive autobiographical entry in his *Book of the Two Pieces of Advice*; 2) a long biographical entry in the *Sources of Information on the Classes of Physicians (Kitāb ‘Uyūn al-anbā‘ fī ṭabaqāt al-āṭibba‘)* by his near contemporary Ibn abi Uṣaybi‘a (d. 1270); and 3) remarks in his extant work from which one can derive biographical information.

‘Abd al-Laṭīf al-Baghdādī was born in 1162 in his grandfather’s house on a street called Darb al-Fālūdhaj in Baghdad.11 His student Ibn Khallikān specifies the month as Ṣaḥīḥ al-awwal AH 557 (corresponding to March AD 1162).12 Yet the Baghdad into which ‘Abd al-Laṭīf was born and where he grew up was no longer the intellectual, political, and scientific center of the Islamic world that it had been during its heyday in the ninth century. When the traveler Ibn Jubayr visited it in 1184, he likened it to “obliterated ruins and erased traces, or the spectre of a disappearing ghost.”13 At that time, ‘Abd al-Laṭīf was twenty-two years of age and had already enjoyed an excellent education in the introductory subjects, such as Arabic grammar, lexicology, and poetry, but also in medicine under his tutor Raḍī al-Dawla Abū Naṣr (d. ca. 1182), son of the famous physician Ibn

9. ‘Abd al-Laṭīf al-Baghdādī, *Kitāb al-Naṣihatayn min ‘Abd al-Laṭīf ibn Yusuf ilā-l-nās kāffatan*, Bursa, MS Hüseyin Çelebi 823, item no. 5 (henceforth MS HÇ823; folio numbers are followed by “a” for recto and “b” for verso, and, where necessary, by the line numbers). The philosophical section is found on fols. 78b–100b, and the biographical remarks on fols. 88b–100b.

al-Tilmīdh (d. 1165). Yet ‘Abd al-Laṭīf soon found that he had learned all they had to teach.

He therefore embarked on a number of short journeys in search of knowledge. He traveled, for instance, to Mosul, some four hundred kilometers north of Baghdad, but was again disappointed by the instruction available there. Consequently, ‘Abd al-Laṭīf left for Damascus in 1190 to complete his education not only in the traditional (or Islamic) subjects, but also in the ancient (or foreign) sciences. The former included law, jurisprudence, and ḥadīth (the utterances of the Prophet Muḥammad), whereas the latter dealt with mathematics, medicine, and philosophy. From Damascus, he set out to Jerusalem and St. Jean d’Acre (‘Akkā). He secured the patronage of Saḥāḥ al-Dīn (Saladin, r. 1169–93) and other Ayyubid rulers and obtained permission to push on to Cairo. There he encountered medical luminaries such as Ṣāḥāḥ al-Dīn ʿImrān Mūsā ibn ʿUbayd Allāh Maymūn, better known as Maimonides (d. 1204). The great epidemic that hit Egypt in 1201–2 formed a fault line, affecting the fates of many of his contemporaries; it also provided him with enough specimens of human skeletons to challenge Galenic anatomy. The ample patronage that he enjoyed allowed him to devote his life to research and study, without having to worry about the material aspects of his private and professional existence. After further travels to Aleppo and Anatolia, he died in his native Baghdad on 9 November 1231, at the age of sixty-nine, and was buried next to his father Yūsuf in the Wardiyah cemetery.

Some of ‘Abd al-Laṭīf’s students included the biographer and chronicler Ibn Khallīkān (d. 1282); the historian and statesman Ibn al-ʿAdīm (d. 1262); the botanist Ibn al-Ṣūrī (d. 1242); the judge al-Tīfāshī (d. 1231);

1253), noted for his works on magic, precious stones, and sexual hygiene; and the ḥadīth scholar al-Bīrżālī (d. 1239).

His Medical Works

Unfortunately, most of ‘Abd al-Laṭīf’s own medical oeuvre is lost today, but a number of interesting and important works by him remain. Apart from the Book of the Two Pieces of Advice, they are the following: a larger book, On the Principles of Simple Medical Substances and their Natural Qualities (Fi Usūl mufradāt al-ṭibb wa-kaṣīfīyyāt ṭabā‘ī‘i ‘ihā‘); a shorter treatise entitled Medical Aphorisms Extracted by ‘Abd al-Laṭīf (Fuṣūl ṭibbīyya Ḃtāṣa‘ahā ‘Abd al-Laṭīf); a Book on the Senses (Maqāla fi al-Ḥawā‘iṣ), investigating sense perception; a didactic treatise entitled Questions on Natural History (al-Masā‘il al-ṭabī‘īya), dealing with problems of natural history in the large sense (i.e., including certain aspects of medicine); a commentary on Ḥunain’s Medical Questions (al-Masā‘il al-ṭibīyya); a medium-length treatise, On the Disease Called Diabetes (Fi l-marāḍ alladhī yuṣammā diyābī‘ī‘a); a critique of Fākhr al-Dīn al-Rāzī’s Commentary on the first section of Avicenna’s Canon of Medicine discussing generalities (Kullīyāt); and two commentaries on...

25. Preserved in Paris, Bibliothèque Nationale de France, MS fonds arabe 2870, item 2, on fols. 128a–172b.

28. Contained in MS HÇ823 on fols. 1b–19b and 28a–34a. Its full title in the manuscript runs as follows: “The Papers which I wrote regarding the book by Muḥammad ibn ʿUmar, known as Ibn Khāṭīb al-Raŷ [“son of the orator from Rayy”] which he wrote about some of the first part of the Canon [by Ibn Sinā], which [part] is called Generalities (Al-Awmaq allatī ‘amilahā ‘alā kītab Muḥammad ibn ‘Umar al-mā‘rīf bi-bn Khāṭīb al-Raŷ alladhī ‘amiluhā ‘alā ba‘d al-ja‘z al-a‘wal min Kītab al-Qunān wa-ḥaww al-mulaqqab bi-l-kullīyā‘).”
works by Hippocrates, namely the Aphorisms (Kitāb al-Fuṣūl), and the Prognostics (Taqdīmat al-maʿrifa). Two works often attributed to ʿAbd al-Laṭīf were not actually by him: the Book of Medicine Derived from the Book [i.e., the Qurʾān] and the Tradition [sc. of the Prophet] (Kitāb al-Ṭibb min al-kitāb wa-al-sunnah) was actually composed by the Damascene scholar Shams al-Dīn al-Dhahabī (d. 1348), and the Forty Medical Traditions (Kitāb al-ʿArbaʿīn al-ṭibbiyya) was written by ʿAbd al-Laṭīf’s student Muḥammad ibn Yusuf al-Birzālī (d. 1239).

This list of titles already shows that, in his general medical outlook, ʿAbd al-Laṭīf partly followed the fads of his times but also broke with previous tradition. Like most of his contemporaries, he adhered to the Galenism of late antiquity as it filtered into the medieval Islamic world through the Arabic versions of Hunain ibn Isḥāq and his school. The towering figure of Ibn Sīnā had come to dominate philosophy and medicine alike; his Canon of Medicine, for instance, ruled supreme in later centuries. We shall see toward the end of this article that ʿAbd al-Laṭīf viewed this dominance with an unfavorable eye. Finally, like other authors of his day, he wrote commentaries and abridgments. Sometimes scholars have dismissed these two genres as unfit for independent reflection or original research, but nothing could be farther from the truth. His Book of the Two Pieces of Advice, moreover, is quite unique.

ʿAbd al-Laṭīf composed it as a diatribe directed against false knowledge, which, according to the author, is worse than ignorance. As the title suggests, it is divided into “two pieces of advice,” that is, “advice” for would-be physicians and would-be philosophers, respectively. Both incur ʿAbd al-Laṭīf’s scathing criticism and find themselves lambasted in no uncertain terms. The first part, rebuking the doctors of his day, contains four main themes, all of which also figure in the passages discussed below: 1) medical epistemology; 2) charlatans and quacks, called “spongers” (mustarziqa) by ʿAbd al-Laṭīf; 3) the idea that book learning is not sufficient for practicing medicine; and 4) the danger of using purgatives without the neces-

sary skill. In general, ‘Abd al-Laṭīf laments the pitiful state of medicine. He does not tire to extol the virtues of the ancients such as Hippocrates, Dioscorides, and Galen. Their skills and know-how form a stark contrast to the inability of his contemporaries.34

The Greek Foundations of Medical Epistemology: The Three Sects

The first recurrent theme in ‘Abd al-Laṭīf’s Book of the Two Pieces of Advice is medical epistemology: how can one know the nature of a disease and decide on a treatment? As is often the case in the medieval Islamic medical tradition, previous Greek ideas and debates set the tone for further discussions and developments.35 In the following passage, ‘Abd al-Laṭīf contrasts the physicians of his day, who in his eyes were just useless, with the past three sects that Galen described, namely the rationalists (also known as “dogmatists”), the empiricists, and the methodists.36 The rationalists sought to know the hidden causes of the body in order to understand diseases and find treatments, whereas the empiricists adhered to a certain medical skepticism: physicians can never know the inner workings of the body and should therefore limit themselves to using therapeutic procedures that have worked in the past.37 However, the latter did believe that, in certain circumstances, past individual or collective experience (called autopsia and historia, respectively) did not suffice. In these cases physicians needed to use analogy, for instance, to transfer a treatment

36. This tripartite division became famous through Galen’s introductory works; see Richard Walzer and Michael Frede, Three Treatises on the Nature of Science (Indianapolis: Hackett, 1985), containing an important introduction by Frede and three works by Galen in English translation: 1) On the Sects for Beginners, 2) An Outline of Empiricism, and 3) On Medical Experience.

from one place of the body (e.g., the hand) to another (e.g., the foot), or to substitute one drug (e.g., lemon) with another similar one (e.g., lime). The third sect, that of the methodists, followed one simple method, hence their name.\textsuperscript{38} It explained all medical conditions in terms of flux (\textit{rhúsis}) and constipation (\textit{stégn¯ osis}). Galen himself was totally opposed to methodism but otherwise adopted a somewhat flexible position. He recognized logic and reason as extremely important to the medical art but also thought that experience, when properly qualified, constituted an important weapon in the physician’s arsenal.\textsuperscript{39}

‘Abd al-La’t¯ ıf describes Galen’s attitude regarding the three sects and juxtaposes their ancient adherents to his own contemporaries:

He [Galen] complained about the methodist sect and the empiricist sect. Even though they all generally fall short and are deficient, they have useful rules [\textit{daw¯ abi.t}] and principles [\textit{fad¯ a ʾil}], which it is best to acquire and learn, especially those of the empiricists. Galen reported many of their procedures in his \textit{On Compound Drugs according to Places} [\textit{May¯ amir}] and \textit{On Compound Drugs according to Types} [\textit{Q¯ a.t¯ aj¯ anis; katà gén¯ e}].\textsuperscript{40} Our contemporaries do not belong to any of the three sects which he [Galen] defined in his book \textit{On the Sects [for Beginners]}, but rather rely on luck and chance [\textit{al-bakht wa-l-ittif¯ aq}] like a blind man shooting [an arrow] without knowing in which direction the target is. The sects of the methodists and empiricists know the direction of the target, but shoot [the arrow] without first examining its [the target’s] specific position. The masters of reason [the rationalists] know the direction and examine the position of the target, directing their arrow there in the most perfect and correct fashion. The empiricists examine certain aspects of the target, such as its shadow, so that they deserve to hit the mark. The people of our time, however, do not examine the target, nor its direction, and one is therefore surprised not by their making a mistake, but by their getting things right, whereas one is surprised by the mistake of the rationalists, and not their getting things right.

\textsuperscript{39} See Philip J. van der Eijk, “Galen’s Use of the Concept of ‘Qualified Experience’ in His Dietetic and Pharmacological Works,” first published in Armelle Debru, \textit{Galen on Phar-

\textsuperscript{40} Galen’s work \textit{On Compound Drugs According to Places} ([\textit{Περὶ συνθέσεως φαρμάκων τῶν κατὰ τόπους, de compositione medicamentorum secundum locos}) was known under its Syriac title \textit{May¯ amir} (literally ’treatises’), whilst his \textit{On Compound Drugs According to Types} ([\textit{Περὶ συνθέσεως φαρμάκων τῶν κατὰ γένη, de compositione medicamentorum secundum genera) was known under the end of its Greek title “according to types (\textit{katà gén¯ e})” in its Arabised form; see Manfred Ullmann, \textit{Die Medizin im Islam} (Leiden: Brill, 1970), pp. 48–49; and Sezgin, \textit{Medizin} (n. 29), pp. 118–20.
For the latter get things mostly right—and essentially right at that [waa-bii-l-dhaati], whilst making mistakes only rarely—and accidentally [bii-l’araʃt]. But these spongers [al-mustarziqa] rarely get things right, and only accidentally, whilst mostly making mistakes, and essentially at that.

We add the following as an explanation through an example which we posit.

Take a man who suffers from fever. A physician of each of the sects comes to him. The methodist aims at loosen[ing] him [the patient] insofar as the fever arose out of stricture [ikhtinnaq, corresponding to stºgnosi]. The empiricist says: “I have observed [raṣadtu] many times people suffering from such a fever. I resorted to blood-letting, and extracted such-and-such a quantity of blood until he [the patient] fainted. Yet afterwards he [the patient] recovered from his fever in one go.” The rationalists will make the fever into a genus [jinsi], divide it by its essential differences [juṣul dhatiya] into three species [anuwa], He [the rationalist] then looks at the fever of this man [to determine] of which of the three [species] it is. He determines that it is a fever which has [disease] matter [al-ḥummā dhaṭ al-madda]. Then he divides this fever into its species according to the [disease] matter, and determines that it [the fever] is bloody. He divides the bloody [fever] into the pure [al-khālsa] and the mixed [al-mashuba], and finds that it is pure. He divides the pure [bloody fever] further into that which has putrefied, and that which has begun to boil, and finds that it is that which has begun to boil. Then he considers the location, the age, the present time, the habit, the past regimen, and other things of a nature to change the diagnosis [al-hukm]. From all these collected facts he derives a picture of the necessary regimen. Then he lets the blood [of the patient] until he faints. I wished I knew who of these three physicians more accurately gets things right, and errs less frequently. Yet no intelligent man can choose anyone other than the rationalist, judging him to be skilful and wishing him victory and success [al-zaʃar wa-l-falaḥ].

As ‘Abd al-Laṭīf explains, Galen recognized that one can derive certain benefits from the empiricists and even the methodists; after all, Galen himself quoted them in his works on compound drugs. As ‘Abd al-Laṭīf is wont to do, he then lambasts his contemporaries as being totally incompetent; they do not belong to any of the old sects at all. He employs the image of archery here, a theme on which he expands later in his treatise. As a true Aristotelian, ‘Abd al-Laṭīf clearly aligns himself with the rationalist sect. The first paragraph echoes a topos that constantly recurs in the Book of the Two Pieces of Advice; the ancient physicians were far superior to

41. MS HÇ823 fol. 67a, line 10–68a, line 5; the Arabic text is printed as T 1 in the Appendix.
their modern colleagues, and the medical art in ‘Abd al-Laṭīf’s day is in a sorry state of steady decline.

In the second paragraph, ‘Abd al-Laṭīf illustrates the approaches of the three sects through an interesting example, namely how physicians of each of the three sects would treat a patient suffering from fever. In this, he follows Galen’s On the Sects for Beginners, where an exponent of each sect explains the principles to which he adheres. Galen made the point that the empiricists and rationalists do not differ in the way in which they treat their patients, but merely in the way in which they arrive at the right treatment. Both, for instance, agree that in case of a rabid dog biting a patient, one should clean the wound and keep it open as long as possible. In ‘Abd al-Laṭīf’s example, too, both the empiricist and the rationalist resort to the same treatment, blood-letting until the patient faints. They differ, however, as to how they arrive at this treatment.

‘Abd al-Laṭīf describes how rationalists divide and subdivide the fever of the patient. This method of division or “dieresis” (διαίρεσις; taqṣīm, taṣmīf) figured prominently as a didactic technique in late antique Alexandria, and found much favor in the medieval Islamic world, as this extract also shows. One wonders, however, whether there are not ironic overtones in his description of the rationalist doctor’s dividing and subdividing. Such a suspicion is further confirmed by the end of the passage. There is a clear contrast between the sentence beginning “I wished I knew who . . .” (fa-man turā laita shīrī . . . ) and the next, where he states, “Yet no intelligent man can chose anyone other than the rationalist, judging him to be skilful” (fa-lāqila illā wa-huwa yakḥitūrū sāhiba l-qiyyās wa-yakhkumu lahu bi-l-ḥidhqi). Moreover, ‘Abd al-Laṭīf resorts to irony in other works such as his Book of Instruction and Admonition and his Epistle on the Dispute between the Two Sages, the Alchemist and the Theorist [Risāla fi Mujādalat al-ḥakimain al-kīmiyā‘i wa-l-nāzar].

45. For the Book of Instruction and Admonition, see n. 6. The Epistle on the Dispute is an extensive treatise dealing with a dispute between an exponent of alchemy and of theo-
We shall return to the question of ‘Abd al-Laṭīf’s embracing rationalism toward the end of this article. Some of his colleagues, however, rejected Greek medical doctrine in general, and rationalism in particular. They took a skeptical stance and doubted the epistemological underpinnings of Greek medical theory.

“Transfer”: The Change of Time and Place

One technique of the empiricists, as we have seen, was to use “transfer” or “analogy” to deal with new situations. Some of ‘Abd al-Laṭīf’s contemporaries rejected the idea that one could just transfer descriptions of Greek diseases and their therapies to another time and place, namely their own. ‘Abd al-Laṭīf first describes their view, and then sets out to refute it in no uncertain terms:

Some of those may say that the medicine of Hippocrates and Galen was appropriate for the country of the Greeks, but that the lands of Syria [Bilād al-Shām] and Iraq do not allow for it [i.e., that the medicine of Greece is not appropriate for other regions]. Only someone who has not read the books of the ancients and has not tested their content at all [wa-lā jarraḥa shay’ān mimmā ǧiḥā] could think this! Do you believe that when the stars circle [in the sky] they change the nature of people only, without [changing the nature of] plants and other living beings? If this were the case, it would indeed be amazing. If they changed everything, however, then the opium will be hot, and pepper cold; the meat of fish hot and the meat of the lion cold; the lion will be cowardly and the hare brave. Thus their opinions change about the nature of drugs and foods—whether derived from plants, animals, or minerals! Moreover, we find that Hippocrates agreed with those [living] long before him about the nature of things. He tested [imtaḥana] what people of old had said and found that in his day things had not changed; their [the ancients’] judgements still applied. Likewise, Galen tested all of Hippocrates’ opinions and found them to agree [with what he thought]; and between them there are six hundred years. People still test until today what Galen said and find it to agree [with what they observed]; and Galen lived roughly one thousand two hundred years before!46

---

46. MS HC823 fol. 74a, line 13–74b, line 7; the Arabic text is printed as T 2 in the Appendix.
‘Abd al-Laṭīf first deals specifically with the problem of transfer in time. He claims that both Hippocrates and Galen were aware of this methodological conundrum and solved it by testing previous procedures. They found that the same remedies still worked for the same diseases. Here again, he stylizes the Greek masters as the models for later physicians to follow. ‘Abd al-Laṭīf continues his refutation by claiming that Galen’s ideas are still proven to be correct in his, ‘Abd al-Laṭīf’s, own day, more than a millennium after Galen’s death. The reason for this is simple. Although the stars influence the conditions in the sublunar world (i.e., on earth where humans live), they do not change the fundamental qualities of nature. Lions are still brave and hares fearful; opium still has a cooling effect, that is to say induces sleep, and pepper still a warming one, meaning that one feels its heat and is stirred into action. All these things can be observed and thus put to the test.

After this passage, ‘Abd al-Laṭīf turns to the second problem, alluded to at the beginning of the quotation, that of place. Some physicians, whom he calls “spongers,” claimed that the inhabitants of Baghdad did not necessarily suffer from the same diseases as the Greek; they lived, after all, in different “Ptolemaic climes.” Ptolemy (d. AD 161) divided the “inhabited world [oikoumēnē]” into seven climes, each of which had different properties under the influence of the stars.47 The people of Baghdad lived in the temperate clime, the place where the most excellent people dwelled: they had a moderate complexion and stature, displayed an even temper, assembled in cities, and possessed civilized manners and customs. They were hence healthier than others and not exposed to the same diseases. But again, ‘Abd al-Laṭīf rejects this argument because he is vehemently opposed to the whole concept of medical astrology or iatromathematics.48 For ‘Abd al-Laṭīf, there are no places on earth in which medical knowledge is subject to change and alteration. Rather, medical knowledge belongs to a set of well-defined and universally established principles that are valid everywhere, with the exception of some extreme regions outside the center of the earth. The notion that a medical treatment is suitable for one country and harmful for another is, according to ‘Abd al-Laṭīf, a foolish invention of those who take advantage of the utter simplicity and gullibility that prevails among the masses.49

48. MS HÇ823 fol. 74a–75a.
49. MS HÇ823 fol. 75a, lines 15–17. See also Tamsyn Barton, Ancient Astrology (London: Routledge, 1994), pp. 179–207; Barton, Power and Knowledge: Astrology, Physiognomics, and
The careful reader may well be surprised that ‘Abd al-Laṭīf does not mention Hippocrates’ work *Airs, Waters, Places* in this context. For Hippocrates argues that the environment does have a profound impact on people’s health, so much so that it can alter the physical nature of inhabitants of a certain locality and account for racial differences.\(^50\) And ‘Abd al-Laṭīf knew the Arabic version of Galen’s *Commentary* on this text, for he quoted it in his description of Egypt.\(^51\) Therefore, at first glance it would seem that ‘Abd al-Laṭīf disregards an important tenet of Greek medical theory and that the opponents against whom he argues could rightly claim that medicine should be practiced differently in Iraq and Greece. Yet this conundrum finds a ready explanation. First, ‘Abd al-Laṭīf is mainly concerned here with fundamental qualities, not specific ones. Opium has a cooling effect both in Greece and Iraq; lions are brave in both localities. This does not prevent ‘Abd al-Laṭīf from admitting that a marshy depression is less salubrious than an airy plain, wherever it may be. Second, ‘Abd al-Laṭīf talks about Ptolemy’s theory of climes, according to which the Fertile Crescent and the Greek heartland lie in adjacent climes.\(^52\)

---

\(^{51}\) This Arabic version of Galen’s commentary survives in a single manuscript, Cairo, Dār al-Kutub, MS Šāl‘at Šīb 550, fols. 25b–102b, of which Fuat Sezgin published a facsimile: *Tafsīr Jalālīn Is-Kitāb Buqrāt fi l-‘ahwīya wa-l-miyāḥ wa-l-buldān* (Galen’s Commentary on Hippocrates’ *Airs, Waters, Places*), Manshūrat Maḥdī Ta’rīkh al-‘Ulūm al-Arabiya wa-l-Islāmiya, Silsila Jīm, ’Uyūn al-turāth 66 (Frankfurt: Maḥdī Ta’rīkh al-‘Ulūm al-Arabiya wa-l-Islāmiya fi ’itār Jāmī’at Frankfurt, 2001). Gothard Strohmaier has been preparing an edition of this important Arabic version, lost in Greek, for nearly forty years, and it is forthcoming in the *Supplementum Orientale* of the Corpus Medicorum Graecorum. ‘Abd al-Laṭīf quotes Galen’s commentary in his description of Egypt (Zand, Videan, and Videan, *The Eastern Key* [n. 6], p. 176, lines 1–3). He does not quote verbatim, but rather paraphrases the main idea, as a comparison with the Arabic version shows (p. 78, lines 2–4, fasc. Sezgin); see also the Hebrew version, based upon the Arabic: *Galen’s Commentary on the Hippocratic Treatise Airs, Waters, Places* in the Hebrew Translation of Solomon ha-Meati, ed. Abraham Wasserstein, Proceedings Ha-Akademah ha-le-‘umit ha-Yisraʾel le-madaʾim, vol. 6, no. 3 (Jerusalem: Israel Academy of Sciences and Humanities, 1982), p. 88, lines 7–8.

Be that as it may, debates appear to have raged in medieval Baghdad over the validity of Greek medical theory in a completely different time and place. They find their reflection in the Book of the Two Pieces of Advice, and 'Abd al-Laṭīf comes firmly down on the side of the Greeks and their continued relevance to medical theory and practice. Like many other medieval physicians writing in Arabic, 'Abd al-Laṭīf constructs the Greek past as a touchstone for present practice. This construct then allows him to exclude the medical others, the charlatans or “spongers,” as 'Abd al-Laṭīf calls them.

Against the Greedy Charlatans

Doctors have always tried to delimit themselves from the medical other, the charlatan. They often define the good physician as someone mastering a canon of medical knowledge, possessing a combination of skills, and adhering to a set of ethical standards. Likewise, 'Abd al-Laṭīf decries the wickedness and incompetence of certain medical practitioners of his time. He partly blames the rulers who neglected to examine physicians and sometimes even promoted the wrong ones. Interestingly, like many of his predecessors in the medieval Islamic world, he constructs a glorified past where medical regulation is properly conducted. His ideal place is a somewhat imaginary Constantinople where allegedly only skilled physicians were authorized to practice. He relates how these doctors were trained and examined and how the Hippocratic Oath was rigorously imposed. Moreover, he stated earlier that both Hippocrates and Galen wrote works on medical ethics, and he quoted extensively from them, especially Galen’s book On How to Recognise the Best Physician. By contrast, 'Abd al-Laṭīf describes the situation in his days in the starkest terms:

54. MS HÇ823 fol. 68a, lines 11–13.
I have never witnessed greater neglect of the medical art [than] in the city of Aleppo. For their [the inhabitants’] behaviour was extremely bad, and the ways of their physicians were in such a state of corruption that there was nothing viler than [this]. No power compels them, no religion repels them, no knowledge guides them, no chief guides and scares them. They have one ambiguous method [uslūb mutashābih] from which they rarely deviate, namely, if someone complains to them about a disease, they hasten [‘ājala] to make him drink a purgative in order to collect quickly [ta’ajjala] its price and take the maximum value for it; they pay no attention to whether it is well cooked, and neglect other conditions [necessary for preparing remedies]. They apply this to someone about whom they had a report without actually seeing him. Their only concern is to pilfer the price of the purgative; they employ all sorts of ruses to do so, and do not care at all how they kill through these means, and sell a man’s life for a farthing!57

We have here a clear image of one aspect of medical charlatanry: lured by lucre, the practitioners will do anything to make a quick buck. They are incompetent; like the methodists, they follow one simple—and insufficient—method. It consists of quickly administering any easily available drug without regard to its effect. Making money, not curing the ill, is their prime concern. Yet, there is also a more subtle way in which the medical mountebanks operate.

Cristina Álvarez-Millán has persuasively argued that physicians in the medieval Islamic world tried to show themselves as proficient in complicated medical theories and intricate treatments in order to promote their standing in the medical marketplace.58 Her surmise finds an interesting confirmation in the following passage, where ‘Abd al-Laṭīf recounts how physicians try to impress patients by giving themselves an air of learnedness. They use extremely complicated procedures, where simple ones would suffice:

Their trickery and treachery extends to lengthening prescriptions and multiplying ingredients without any regard to how their powers interact with each other, and without having any experience [tajriba] with their effect. They do this either to make the common crowd stand in awe of themselves and the extent of their knowledge, or to achieve a tidy profit when people buy the

57. MS HÇ823 fol. 69a, line 11–69b, line 1; the Arabic text is printed as T 3 in the Appendix.

necessary drugs from them or from an apothecary ['attār] who is in cahoots with them. One of them may enter the patient’s [sickroom] many times a day, each time prescribing some new treatment. He thereby intends to make an impression when he enters, and to display each time some practical [skill (‘amāḥ)]. The most excellent [al-fādil] among them employs changes which resemble each other [i.e., he only alters the treatment in appearance, but does not change it fundamentally]; perhaps he uses another doctor’s recipe, adding or reducing things which neither have any benefit, nor cause any damage. His aim is thus to show that he is more excellent than others, and to point out his rank. This and other men like him I do not despise as much as I despise the first one. For the former provides some benefit to him [the patient], and does not harm anybody. But how much does the one whom I despise profoundly damage people! May God provide refuge! Be careful not to become one of those who trade the place in the hereafter for this world, and whose religion is influenced by carnal desire [hawāhu].

‘Abd al-Laṭīf highlights here two important aspects of medical practice in his day: the competitive nature of the medical marketplace and the element of performance required to prevail within it. Moreover, he hints at fraud through selling drugs at inflated prices, either by the doctors themselves or their apothecary accomplices. The second part of this quotation seems to suggest that ‘Abd al-Laṭīf accepts that a certain amount of showmanship is necessary to attract and retain patients, or to make them follow doctor’s orders. Yet others are truly evil in that they knowingly harm their patients through their fraud. These physicians are even worse than their female and itinerant competitors.

Bad Physicians (“Spongers”) Worse than Women and “Empirics”

In Galen’s classification, the empiricists are physicians who rely on tried and tested remedies that have worked in the past, without seeking to know how they work. In later times, when the rationalist approach came to dominate medical discourses both in the East and the West, these empiricists were often regarded as little more than “empirics,” a term used synonymously for “quack.” In ‘Abd al-Laṭīf’s world, most elite medical physicians defined and distinguished themselves through a canon of

59. MS HÇ823 fol. 77b, lines 5–14; the Arabic text is printed as T 4 in the Appendix.
60. For a manual on drug trade by the slightly later author Abū l-Munā al-Kūhīn al-‘Aṭṭār (fl. 1260), see the recent study by Leigh Chipman, The World of Pharmacy and Pharmacists in Mamlūk Cairo (Leiden: Brill, 2009).
medical knowledge largely based on Greek sources, as well as a code of medical ethics that they promoted. A clear hierarchy therefore existed: itinerant practitioners and female providers of care frequently found themselves the object of scorn and ridicule on the part of this medical elite. Yet, and somewhat surprisingly, for ‘Abd al-Laṭīf these highway doctors and women do more good and less harm than their overconfident elite competition, as he explains:

I say that strangers (ghurabā’) who sell potions on the highways are superior to those [physicians]. Firstly, because most people, and especially the elite, beware of them and do not hand themselves over to them. Secondly, they give [the milky latex of] spurges [yattūʿāt] and [the juice of] bashbūs, that is colocynth leaves, to healthy people whose temperament can bear mistakes more than sick patients. They mostly administer their drugs to peasants and [other] hard-working people, whose temperament can bear strong drugs. Moreover, the strangers have tried and tested drugs [adwiyā mujarraba muṭtahāna] and tried herbs which they gather and test themselves [dʿishāb mujarraba hum yajtanāhā wa-yamṭahināhā]; and they tell each other what they know about them.62

‘Abd al-Laṭīf insists on the fact that highway practitioners use drugs of which they have experienced the benefits—the verbs “to try [jarraba]” and “to test [imtahāna]” recur a number of times. The cautious empirical approach is to be preferred to that of rational physicians who, carried away by a false belief in their abilities, resort to radical treatments that have never been tested. To put it differently, rationalism can have worse effects than empiricism when one does not master the art of medicine fully. In the absence of correct and detailed medical knowledge, it is preferable to rely on simple, tried and tested drugs and therapies. This does not mean, of course, that ‘Abd al-Laṭīf generally favored empiricism. At the beginning of this article we have seen that rationalist medicine is the way forward for him; moreover, his criticism of medical education in his day, which will shortly come under scrutiny, further confirms that he is a rationalist.

That peasants and laborers should seek medical care from itinerant practitioners rather than the physicians in attendance at the courts of the caliph appears, at first glance, to be obvious. This passage, however, offers a rare comment on the stratification of medical services from an elite physician. For ‘Abd al-Laṭīf appears to imply that the clientele of his peers largely consists of people who do not have to carry out manual labor;

62. MS HÇ823 fol. 71b, line 13–72a, line 3; the Arabic text is printed as T 5 in the Appendix.
while the highway physicians cater to the lower classes, strengthened and hardened by their daily toil.

Elite physicians often lament the fact that their patients turn to women rather than themselves. In the early tenth century, Abû Bakr Muḥammad ibn Zakariyāʾ al-Rāzī, for instance, wrote a number of short epistles in which he raved against them.63 Some 150 years later, the Christian physician Ṣāʿīd ibn al-Ḥasan exclaimed: “How amazing it is [that patients are cured at all], considering that they hand over their lives to senile old women! For most people, at the onset of illness, use as their physicians either their wives, mothers or aunts, . . . ” Ṣāʿīd specifically refers here to the figure of the old woman peddling her remedies, well known both in the medieval Islamic world and Europe.64 But yet again, we find ‘Abd al-Laṭīf breaking the mold and declaring that old women, like highway physicians, can offer care superior to their elite male competitors:

Therefore, I say that the medicine of old women is better than that of those [physicians who killed the prince]. For the woman only applies the things which she saw to be successful, and the benefit of which she has experienced [jarraḥa]. She is therefore close to the empirical sect [firqat al-tajārib]. Those [physicians], however, take risks [aqḍama] because of false logical reasoning

[qiyyās] and defective opinions [zann mukhtall]. Moreover, the old woman rarely ventures to use [aqdama] a strong and dangerous purgative drug. But if she ventures to use some of it, she does not insist on it nor does she overdo it. Rather, if she observes its success, she is confirmed [in her opinion], yet otherwise, she desists [from using it].

Just preceding this passage, ‘Abd al-Laṭīf has related how the prince al-Malik al-Zāhir Ghāzī ibn Yusuf of Aleppo, one of the sons of Sultan Salāḥ al-Dīn was treated by various quarrelling court physicians and eventually died at their hands through purgatives and astringents. ‘Abd al-Laṭīf thus contrasts the latters’ perilous prescriptions with the more moderate medicaments made by old women.

Moreover, the point made here about women being close to the empirical sect and better than some male rationalist doctors is remarkable for two reasons. Firstly, medical historians have slowly come to realize that much medical and paramedical care or “bodywork,” to use a recent coinage, was provided by women in premodern societies, even if their names are hardly ever recorded in the histories written mostly by men. In medieval Islamic societies, they appear to have competed with their male counterparts within the medical marketplace and did not just restrict their attention to the domestic space. This quotation confirms this analysis. Secondly, ‘Abd al-Laṭīf further develops the idea, already present in the previous passage, that experience can be better than rationalist medicine when the latter is misunderstood. He extols female practitioners for their use of experience and observation, whilst chiding male practitioners for their errors. In both aspects, ‘Abd al-Laṭīf, a male elite rationalist physician, goes against the grain of most of his colleagues, as he praises women and empiricism.

At the beginning of this article, we suggested that ‘Abd al-Laṭīf displayed a certain irony in his description of the rationalist doctor dividing and subdividing fevers. In the last two quotations, he further criticized certain rationalist physicians of whom he might have thought when giving the example of the rationalist doctor diagnosing and treating fever.

66. MS HÇ823 fol. 71a, lines 11–15; the Arabic text is printed as T 6 in the Appendix.
That he disapproved of certain didactic techniques such as learning by rote can also be seen from his criticism of medical education.

Textbook Knowledge Not Sufficient to be a Physician

As ‘Abd al-Laṭīf already stated, it is dangerous for physicians to rely on false logical conclusions when treating patients. In the following quotation, he makes this point more explicitly. He first describes the current state of learning: students master only the basic principles of the medical art and learn definitions by heart, without really having a thorough grasp of the subject. This, however, is a dangerous development.

Those who occupy themselves at this time with medicine usually read a bit in the Generalities of the Canon [i.e., the first part of Ibn Sinā’s Canon of Medicine dealing with general principles (kulliyāt)]. Then they learn by heart the definition of medicine [tibb], the definition of the element [usṭuqs], the definition of temperament [mizāj] and the like. They have disputes about it [these definitions], and on the subject of this they raise their voices in assemblies and markets. Afterwards, they proceed to treat [patients] in the [false] opinion that this [alone, i.e., basic book learning] is beneficial and suffices, and that he who knows the definition of medicine correctly is able to cure [patients] of fevers and other [diseases], and knows their different kinds. I admonish those who take my advice [nasiḥati], if they want to be physicians [ṭabīḥ], not to abandon Galen’s and Hippocrates’ books.70

‘Abd al-Laṭīf continues to challenge his reader, saying that if he does not trust him, he should see for himself. When comparing the various works of Galen, such as On Temperaments or the Small Book on the Pulse, with the relevant chapters in Ibn Sinā’s Canon or other works, his reader will find that Galen had at least as great an ability to compose medical works as later authors. ‘Abd al-Laṭīf proceeds with his polemic by insinuating that if reading all of Galen takes the reader too long, he can always resort to abridgments [mukhtaṣarāt, ikhtiṣārāt] of Galen’s works, and concludes:

If he wants to read works by recent authors to enjoy [ʿalā l-tanazzuh] the extent of the scholars’ knowledge, their different abilities to understand, the quality of their abridgments and explanations, then so be it. Those, however, who think that the Royal [Book by al-Majūsī], the Hundred Books [by al-Mashiḥ], and the Canon [by Ibn Sinā] suffice and make Galen’s works superfluous adhere to a false opinion.71

70. MS HÇ823, fol. 73b, lines 1–7; the Arabic text is printed as T 7 in the Appendix.
71. MS HÇ823, fol. 73b, line 17– fol. 74a, line 3; the Arabic text is printed as T 7 in the Appendix.
‘Abd al-Laṭīf lambasted the medical education of his day. Three interrelated aspects, in particular, incur his criticism: the limited knowledge of the students, their fondness for boastful displays of their argumentative abilities, and their love of lucre. We have already seen that ‘Abd al-Laṭīf disapproved of his colleagues’ obsession with showing off their knowledge rather than caring for their patients. It therefore comes as no surprise that he depicts the medical students as following their masters’ wicked ways: motivated by money, they swagger around the medical marketplace and, like mountebanks, endeavor to take in the poor patients in awe of their self-proclaimed educational achievements.

‘Abd al-Laṭīf does, however, make a more fundamental point: the students should not rely solely on abridgments and compendia, but rather consult the actual works of Hippocrates and Galen. Al-Majūsī’s Complete Book on the Medical Art [Kitāb al-Kāmil fī l-ṣinā‘a al-ṭibbiyya] and Ibn Sīnā’s Canon of Medicine [Kitāb al-Qānūn fī al-ṭibb] had quickly become standard medical textbooks. The first part of the Canon, dealing with general principles [kullīyāt], proved to be particularly popular. Moreover, already in late antique Alexandria, students often studied Hippocrates and Galen not in the original, but in the so-called Alexandrian Summaries.72 This trend continued in the medieval Arab world, and ‘Abd al-Laṭīf was by no means the first to censurate it. Already in the eleventh century, Ibn Riḍwān (d. 1068) attacked it in scathing terms:

Summaries and commentaries of Galen’s books do not make the latter superfluous. Summaries fail to encompass all of Galen’s ideas, while commentaries increase the length of the art, and distract [students] from studying, since, of necessity, these would have to be read for verification together with their [original] medical works.73

‘Abd al-Laṭīf’s outburst thus confirms that students continued to prefer easy abridgments to Galen’s often long-winded prose.

At first, it may seem strange to the modern reader that both ‘Abd al-Laṭīf and his predecessor Ibn Riḍwān advocated a careful reading of Hip-

---

pocrates and Galen, rather than more modern works. Yet, when ‘Abd al-La’tif enjoins his contemporaries “not to abandon Galen’s and Hippocrates’ books,” his message is twofold: firstly and explicitly, that one ought to have a comprehensive grasp of medical literature and learning; and secondly and implicitly, that one ought to follow the example of Hippocrates and Galen, who both were great clinicians, took case notes, and did not simply rely on logical reasoning, but also on practical experience.

Conclusions

As we have seen in the opening pages of this article, the thirteenth century is often perceived as the beginning of the end: through the rise of religious orthodoxy and bigotry, the sciences were hampered, philosophy stifled, and practical medicine neglected. Scholasticism, the awe of past authorities who go unchallenged, reportedly ruled supreme. The examples from ‘Abd al-La’tif al-Baghdādī’s *Two Pieces of Advice* discussed above do not fit this vision of the beginning of the end. To be sure, ‘Abd al-La’tif himself suggested that medicine was in a state of decline and that most of his contemporaries were little more than profiteering mountebanks. In this he joins generations of physicians and littérateurs who follow the Horatian maxim that the old man should “praise the past when he was a boy, and decry and rebuke the younger generation” (*laudator temporis acti/ se puero, castigator censorque minorum*). On the other hand, ‘Abd al-La’tif himself disproves the notion of decline, for he appears as a highly original thinker.

Let us briefly revisit where ‘Abd al-La’tif offers novel insights and interpretations. Unlike many of his elite colleagues, he recognized the potential of highway physicians and female practitioners in the provision of medical care. He framed his analysis in a remarkable reinterpretation of Galen: the perceived “empirics” were really “empiricists” who did not deserve to be totally dismissed. His thinly veiled criticism of his rationalist contemporaries hit home heavily. Their practice centered around scoring cheap debating points and impressing potential patients. The origins for this phenomenon lay in the medical education of ‘Abd al-La’tif’s day: it was too “scholastic,” relied too heavily on a restricted number of authoritative texts such as the “Generalities” in Ibn Sīnā’s *Canon*.

to be sure), and criticized people’s reliance on Ibn Sinā. Dimitri Gutas
detected similar tendencies in the philosophical part of ‘Abd al-Laṭīf’s Book
of the Two Pieces of Advice, where ‘Abd al-Laṭīf advocated reading the Greek
masters such as Plato and Aristotle rather than relying on Avicenna.75 Yet,
Gutas recently argued that the Two Pieces of Advice also contains an inter-
esting and original defense of philosophy.76 The traditional narrative of
Islam’s decline would have us believe that al-Ghazālī’s Incoherence of the
Philosophers ushered in an age of decline. Gutas, however, shows that ‘Abd
al-Laṭīf’s attack on second-rate philosophers, some of whom take their cue
from al-Ghazālī, actually illustrates the vibrancy of philosophical debate
in the Islamic colleges.77 ‘Abd al-Laṭīf therefore is an exponent of what
Gutas calls the “golden age of Arabic philosophy.” Our own investigation
has shown that ‘Abd al-Laṭīf had some original ideas about epistemology,
and therefore confirms Gutas’ analysis. In the area of medicine, more
specifically, ‘Abd al-Laṭīf had new and startling things to say. Nor did
‘Abd al-Laṭīf shy away from criticizing Galen for his anatomical views. In
some ways, one could argue that he resembles the Renaissance Humanists
who raised the rallying cry: “[Back] to the sources” (ad fontes). All over
Europe, many medical men of the time took up and advocated a return
to Hippocrates and Galen.78 ‘Abd al-Laṭīf had a similar agenda, marked by
both a certain antiquarianism and a striving for modernity. He enjoined
students to read Hippocrates and Galen in order to grasp the complexi-
ties of the medical art, not as authorities who could not be challenged.
He thus followed in the footsteps of the greatest medieval clinician, Abū
Bakr Muḥammad ibn Zakariyā’ al-Rāzī, in that he both respected and
criticized past Greek authorities.79

Decline and Decadence in Iraq and Syria?

‘Abd al-Laṭīf’s views on medical epistemology and education also have implications for the social history of medicine. He described in detail how elite physicians employed half-learned medical theory to impress patients. Conversely, he extolled those whom the elite of his day labeled as charlatans, the itinerant men and women who provided so much medical care for the masses. Medical education, alternative providers of care in the medical marketplace, and women as patients and practitioners are all, of course, topics of interest to social historians. Ideally it would be possible to compare ‘Abd al-Laṭīf’s observations in his Two Pieces of Advice with other detailed studies of the medical milieu in Syria, Egypt, or Iraq at the time. Yet although scholars have touched on topics relating to the social history of medicine in the medieval Islamic world in general overviews, and written studies of individual aspects of medical care, a detailed and diachronic picture of how medicine and society interacted during the Islamic Middle Ages still lies in the future. It is hoped that subsequent research will shed fresh light on these questions. Yet the present article shows that anyone investigating the social history of medicine during ‘Abd al-Laṭīf’s age will undoubtedly find the Book of the Two Pieces of Advice to be a rich mine of information.

Let us briefly consider a point made by Dimitri Gutas: that ‘Abd al-Laṭīf’s philosophy (like that of Ibn Rushd) had very little impact on later generations in the Arab world. In order to determine ‘Abd al-Laṭīf’s place in the history of medicine, it would be crucial to know how later generations engaged with his work. Many physicians in the medieval and early modern Islamic world came after him, but their works remain largely unstudied and their contribution to medicine unexplored. A catalogue survey of Arabic texts, for instance, lists more than thirty medical authors who lived after ‘Abd al-Laṭīf, each at least with one extant work (but often more); most of them have been neither edited nor studied. We are therefore in no position to judge whether ‘Abd al-Laṭīf exercised any influence

---

on subsequent generations in the area of medicine. Only future research will tell whether later physicians reacted to ‘Abd al-Laṭīf’s ideas and how medicine developed in the postclassical age.

Our main contention in this article is that ‘Abd al-Laṭīf does not fit the traditional narrative of decline and fall triggered by bigotry and military defeat. This begs the question: how did the age from the twelfth century onward acquire such a bad reputation? Here, Latin translations of Arabic medical texts appear to have played a major role. For the last authors writing in Arabic whose works were translated into Latin in any significant way are Ibn Sinā and Ibn Rushd (Averroes). If the medieval monarchs and monks paid no heed to later Arabic works, such as ‘Abd al-Laṭīf’s _Two Pieces of Advice_ or Ibn an-Nafīs’ _Commentary on the “Generalities”_ in Ibn Sinā’s _Canon_, so the argument goes, then they probably did not offer anything worthy of attention. This Eurocentric vision has rightly incurred the criticism of scholars of philosophy and astronomy who now attempt to reassess this whole issue. For instance, Robert Wisnovsky and Jamil Ragep run a large and generously funded project entitled “Rational Sciences in Islam: An Initiative for the Study of Philosophy and the Mathematical Sciences in Islam.” Through it, they aim to provide a first survey of the many texts, mostly only available in manuscript, that belong to this postclassical period. Preliminary results suggest that many Islamic scientists and philosophers “explored the world through rational means” and documented their investigations in their writings.

The example of ‘Abd al-Laṭīf’s _Two Pieces of Advice_ shows that such an endeavor in the area of medicine is also highly desirable. ‘Abd al-Laṭīf stands at the beginning of this postclassical medical world that deserves much more scholarly attention. His ideas about medical epistemology and education and his highly original views of alternative practitioners—notably women—also highlight the necessity writing a social history of medicine for his period and place.

فإن شكاوًا (جانيوس) كانت من فرق أصحاب الجلية وفرق أصحاب التجربة وكانونهم لهم تم قصدهم ضوابط ونفسهم فضائل يصلح أن يقنع ويتعلم ولكن واجبهم أن يptaيع عنهما كثيراً من أعمالهم في المواضيع في قاطعة الناس وما أهل زماناً فأليهما من الفرق الثلاث الذين جهدت في كتاب الفرق ولكنهم من بأب الخبت والانتلاف مثل الأعمى بيرى ولا يدري في أي وجه هو الحفر فإن فريق الجلية والتجربة يعلمنا جهة الحفر ولكن يردنا بعد تم تحسين وضعه القانون وأما (71) أرباب القانون يعلمنا الجهة ويعزون وضع حفرهم وقد عقدوا النحو الهمس أقل تسديد وأقل تصويت وأهل التجربة يكتلون عوزاً من أعراب الحفر كانوا في سبيل الإصابة فما كان أهل زماناً فلان يصوبون الحفر ولا جمهور ذلك صار الضحاء من صوياهم من خطواتهم وأما أرباب القانون يعلمنا من خطواتهم لا من صوياهم لأن تحسينهم على الأكبر ويدفعون في الخبراء على الأقل وبدائعهم ويدفعون في الخبراء على الأكبر والجهاديات ويدفعون في الخبراء على الأقل وبدائعهم وتاريخهم.

وفي قول من مولاه (جانيوس) كتب به بفرط وجاليسون كان بعض بلاد التدیر والنقادة وليست حتى ذلك وهذا حال من لم يقرأ كتب القراء ولا جرب شيء ما فيها أتى الكوكب حيث دارت غير طباعة الناس فقط دون النباتات والجبال والأنسوات. وإن كان هذا أتى هنا لم تجربوا فإن شعوب الأرواء فلا يراكب الأرواء حواري وفاطمة واد. رحمة السماء أخذت واعدهم أنواع فطارة شعب وهو ملائم لفطارة الجملة فعلاً بشاعته وقوة ينفعه أن يردوا بإشراف عامة ولا يجدوا قطوة فيه ولا يجدوا لأشراف ويتمكنون ذلك لم يأخذوا خير من غير معانيه نفسه غير مصلحة منهم المسائل والتحلي عليه بكل وجه ولا يبالون كيف كله بها وتيجعو مهجو نسماً بعدهم.

T 3
ولم ينقدهما من هذه الصناعة بينه بحلك فإنما كسبتهم في خلاة الوداد وطرق أطابقتها على حال من النسب لا يكون أحكامها فلاإنسان بوعه ولا الذين بدأهم ولأعدمهم ولا نسب على غيرهم وفيهم لم يكونوا أشرافاً على تصويتها ستالهم ما لا يعرفون من قبل الأشراف ويطالبون ذلك لم يأخذوا خير من غير معانيه نفسه غير مصلحة منهم المسائل والتحلي عليه بكل وجه ولا يبالون كيف كله بها وتيجعو مهجو نسماً بعدهم.

T 4
ومن مخزونه وتنميه تم تطبيق النسيج وتعكيز الفردات عن غير ماراة بينها فواعها وليست فيه لأحدهم لما يكون عنها ويفعلون ذلك إما لتبجيغ العامه منهم ومنع مجلسهم ويتكرر لهم في إذا أخرجوا خوارجهم من رغم وهو شريك وقد يدخل الواحد منهم على رضوان بنائياً جيداً ولكنه في ذلك أن يكون خلوته أو وفاته في كل مرة عن فأطابقتهم وطبع الفهدن من وراء عرض عليها نفسها سبب طلب آخر يظهر وينبغي ما لا ينبغي وأيشود وقفة ذلك أن يتلم نفسه على إجتهده عليه شأنه وهذا تتبجع فلان وقفه إلا أخبره كأوه الأول لأن هذا يتعينه ويأتيه فلان وأما الذي أكره جداً بما يضر به الناس أعاد الله ولك أن تكون من بيض أخرى به يذكر على دينه و
وأقول إن الغرباء الذين يسيرون الشريات على قوارع الطرق أن أصل من ظلاء أما أولا فلا أن أكبر الناس وحواسهم بحدوثهم ولا يسلمون نعومهم إليهم وإذا فاتهم يستحسنون البوعة والمغاش الذي هو ورد الحنطل الأخصاء وأمهاجهم تحميل الخطا أكبر مما يحمله المرضي وأكبر ما يائمون أربابهم في الفلاحين وأرباب الكور وأمهاجهم تحميل الأدوية القوية ثم أن الغرباء عندهم أدوية

بجرية مشهعة وعذب بجرية هم يحتونها ويمجونها ويتناقلون العالم بها.

وأنا أقول إن طب العجز أفضل من طب ظلاء لأن العجز تعجل ما رأت نجحه وجررت نفسه قريبة من قربة التجارب وأنا

هؤلاء فيقدمون بقياس فاسد وظل محلل لأن العجز قلما تقدم على دواء قوي ومسهل خطير فإن أقدمت على شيء لم تلّج فيه ولم يبال كل أن رأت إما رأت النجح بثبت وأنا أقدم

وأنا المشتغلون في هذا الزمان بالطيب فشأن أن يقرؤوا شيئاً من كتب كتاب القانون فيحفظون حذ الطب وحد الأسطفان

وجدو المراج وأصال ذلك وبجاحون فيه ويرجعون بذلك أصولهم في المجانس والأتساءل ثم يقدمون على العلاج منهم أن ذلك

يجمد عليهم وأنه كافهم وأن من حق حذ الطب قد يبرئ من الحميات وغيرها ويعرف أشكلها وأنه أشير على من يقبل

نصيحتي إن شاء أن يكون طبيباً إنا يدعوا كتب جالبيوس وبقراط [...] إنا شاء أن يقرأ كلما السائحين على جهة الزمان على مقدار العلماء في علمهم وتفاوته في فهمهم وحسن اختصارهم وставилهم

فذلك إليه ومن زعم أن في الملكي وفي كتاب المانه أو في القانون كذبة عن كتاب

Decline and Decadence in Iraq and Syria?  29
